High

Requested By

Domain Administrator

Domain

aklab.local

Service Requested:

The Domain Administrator has requested that a unique employee ID be assigned to every employee account in Active Directory. This is required to improve employee identification, maintain consistent directory records, and support future administrative processes.

Business Justification

Employee IDs will help the organization maintain standardized employee records and distinguish staff members across departments. Completing this request will also improve the accuracy and consistency of employee information stored in Active Directory.

Environment: DC01 (domain controller) and CLIENT01 (Windows client)

1. Issue Description

Every in-scope employee account should have the correct, unique employee ID recorded in Active Directory. Existing usernames, passwords, group memberships, and permissions remain unchanged.

2. Environment

- User account: AKLAB/Administrator
- Shared resource: N/A

3. Investigation

Checking if any unique IDs exist already:

Figure 1: No employee IDs are configured

4. Resolution

Let's autogenerate the employee ID for all the users:

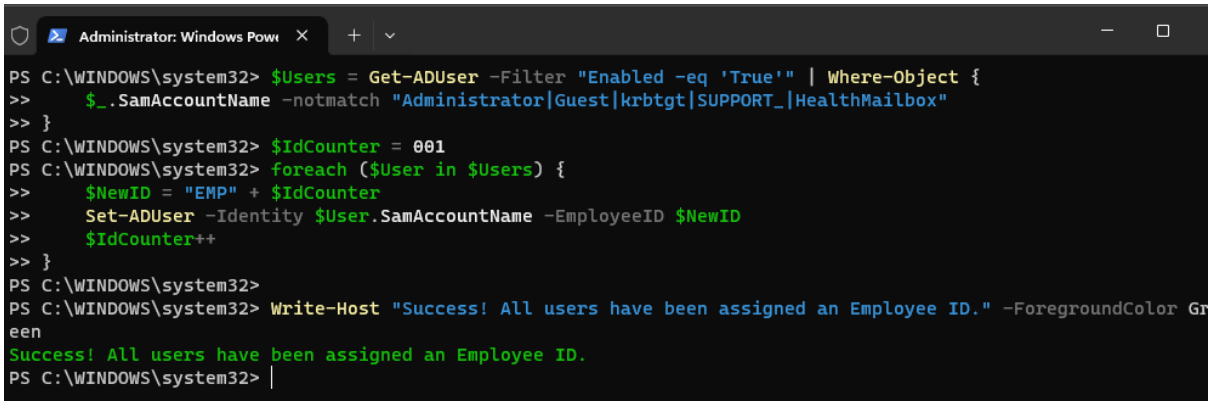

Figure 2: Running code to add employee ID to all the users

Code utilised:

```
# 1. Finding the users which are not System and are active (Enabled)
$Users = Get-ADUser -Filter "Enabled -eq 'True'" | Where-Object {
  $_.SamAccountName -notmatch "Administrator|Guest|krbtgt|SUPPORT_|HealthMailbox"
}

# 2. Beginning the ID counter
$IdCounter = 001

# 3.Applying the loop for the users
foreach ($User in $Users) {
  $NewID = "EMP" + $IdCounter
  Set-ADUser -Identity $User.SamAccountName -EmployeeID $NewID
  $IdCounter++
}

Write-Host "Success! All users have been assigned an Employee ID." -ForegroundColor Green
```

5. Validation

Let's check if the employee ID is assigned to all the users:

```
PS C:\WINDOWS\system32> Get-ADUser -Filter "Enabled -eq 'True'" -Properties employeeID |
>>     Where-Object { $_.SamAccountName -notmatch "Administrator|Guest|krbtgt" } |
>>     Select-Object Name, SamAccountName, employeeID

Name              SamAccountName employeeID
----              -------------- ----------
vboxuser          vboxuser       EMP1
Alex AM. Morgan   alex.morgan    EMP2
John JS. Smith    john.smith     EMP3
John JR. Reed     john.reed      EMP4
Emily ED. Davis   emily.davis    EMP5
Michael MS. Scott michael.scott  EMP6
Olivia OM. Martin olivia.martin  EMP7
Ethan EC. Clark   ethan.clark    EMP8

PS C:\WINDOWS\system32>
```

Figure 3: The command shows the users with the employee ID

Code utilised:

```
# To check the listed users with employee ID
Get-ADUser -Filter "Enabled -eq 'True'" -Properties employeeID |
  Where-Object { $_.SamAccountName -notmatch "Administrator|Guest|krbtgt" } |
  Select-Object Name, SamAccountName, employeeID
```

Ticket Resolved!
