Issue:

Unable to Log In After Four Consecutive Failed Authentication Attempts

I was trying to log in to my account but failed to remember the exact password. Now I am pretty sure of it, but the account is locked, and it says that I may not be logged in now. Kindly unlock the account, as I have a very important meeting in the next 30 minutes, and I will need my resources to share in the meeting.

Environment: DC01 (domain controller) and CLIENT01 (Windows client)

1. Issue Description

The user's domain account was locked after four consecutive failed login attempts. Although the user now remembers the correct password, they are unable to sign in because the account remains locked

2. Environment

- User account: AKLAB\ethan.clarke
- Shared resource: \\DC01\CompanyShare\Marketing

3. Investigation

- Verified the user by asking authentication questions over the call; verified the user successfully.

4. Root Cause

The user's account is not locked, but the account is temporarily locked for 15 minutes because of four invalid logins, as per the account lockout policy.

5. Resolution

Advised the user to wait for 15 minutes after the last invalid login and try entering the correct password.

6. Validation

The user was successfully able to log back into the account

Ticket Resolved!
